

Phragmites

Phragmites
dominating other
weeds

Common reed forming dense patches in wet and fertile soils along banks of ponds, lakes, roads, and ditches. Phragmites can grow to be 3-20 feet tall. This can be a problem plant because once established, it crowds out other wetland plants. They shoot runners towards water, and every few inches, a plant will shoot up.

Management:

**Aquatic glyphosate
(Rodeo)**

Arsenal - Apply in
spring before flower
or in fall

Life Span:
Perennial
